

Module Introduction Transcript

Hello everyone, welcome to module 8 of our course Statistical Inference and Modelling. So far we have studied regression methods that explain relationship between variables at a single point in time, but in various cases data are collected across time such as daily stock prices, monthly sales, yearly rainfall. To analyse and predict such data, we need tools like time series analysis.

This module is all about time series analysis. We will first learn about how to decompose a time series analysis into trends, seasonal, residual components. Second, we will learn how to apply smoothing methods like moving average, exponential smoothing to make forecast.

Third, we will learn how to produce predictive models that can be applied to a wide range of real-time data. By the end of this module, you will be able to analyse the time-dependent data, identify meaningful patterns, and generate forecast for practical decision making. So let's begin.
