

Module Introduction Transcript

Hello everyone, welcome to module 9 of our course Statistical Inference and Modelling. So far, we have studied regression and time series methods. These techniques are designed for predictions, explanation and forecasting.

In this module, we will move to a new era of multivariate statistics called factor analysis. Factor analysis is a method used for data detection, helping us to simplify large set of data and then also comprising it in a way that we can use it in a better ways. You will learn about various different types of things.

Firstly, you will understand the basics of using factor analysis. Secondly, how to apply them. And third, we will use it to analyse sample data that we will be working upon.
