

Tableau Desktop Getting Started Transcript

Now, let us get started with so Tableau, so how to open Tableau app, okay, so, you can instal Tableau by going to this particular link, okay, so you are here, so Tableau for students, okay, you can build skills and get Tableau for free, so once you click this, you have to register here and just download the app, any account would do, there is no need to be a business account, I registered with my personal gmail, you can do that or if you have a business or study account, it would be more advisable, you can use your bits account, so you will, once you do the registration process, you will sign in and then you will get the Tableau public interface which looks like this, okay, so once you, okay, let me sign out and show you this part, so I have registered and you get an authentication email, once you authenticate the email, you would open this public tableau.com app.discover, you can use this html and then this link, you can just sign in with your credentials, so I am signing in with my credentials, you can also do remember me, so yeah, you can do, so now there are, once you are here, you can explore what are the different features, so let me first take a minute back to the presentation and we will come back here, okay, so you will be registering and then you will get an authentication email, then you can go to the particular website, right, which is public.tableau.com and then sign in, you will end up with a page like this and you have a profile here, you can add your picture, you can get credits

I sincerely advise you to explore, I mean set up a profile, so that the people who are working and want to showcase Tableau as a skill set, by sharing your public tableau profile and the dashboards and the visualisations you create there, your employers can get a good view or your community peers can get a good view on the skill sets that you have and you will be recognised in the community, for example, look at the visualisations that are here, so this is the visualisations of the day, human resources dashboard created by Serena, there is Fireflies by Owl City, by Shreya Arya, like that all these people are, these are the profiles where he has created around 361 visualisations and there are about 9000 followers for the scan, so like that you can also improve your footprint in the Tableau domain, which can be very useful for your job orientation or expanding your opportunities.

Now, let us see how to get into the Tableau file, there are two ways here, so once you create, click on create, you have web authoring, so you can click on the web authoring, which will take you to a page like this, which means you are working on the cloud environment, you are working on the web application, the other way to do this is to go and create, download Tableau public edition, okay, so here again you can download the app, which will get then downloaded to your system, so you can operate from there, so let me just show that also, once you get Tableau public in your system, this is what it will look like, so this is what Tableau public, the desktop version will look like and then you can connect from there, now let us start with, so once you open Tableau public, this is how it will look like, so this is the desktop app, which is downloaded into your system and you can also use the web-based version that we were just discussing,

so you can either use the web-based version or you can work in the local system, so the point here is both of them are free, all that you have to do is, you connect your particular excel sheet or any data format that you are trying to work with and then start exploring the trends, okay, so before we get into the content, as always I say, there are so many resources that are available both within the Tableau environment and also by the different free videos that are there, please do explore them, so this is the learn option and the learn tab, which says how-to videos, sample data, community resources, blog and what are the Tableau public FAQs, please do take time and then explore them, since these are very small introduction videos on how to get started, how to navigate the workspace area, which we will be seeing now, how to build charts, right and then how to connect data, so this is a sample EU Superstore, which is a sales data, I am downloading that, so we can also try with that, there are so many sample data sets here, you have entertainments, different public data, education, government, these are different data sets, which talk about a different types of issues out there and in fact, the main point here is, you have different data types, which can be connected or imported into the Tableau environment, which you can then use for building your visualisations, so just for one more point, these are community resources, there is Tableau public blog, community forums, if you have any doubts, you can post questions here and then get your responses, there are community projects also, which will help you learn more advanced data skills, now let us first try a couple of data sets and then see what are the features in Tableau, we will take it from there, okay, so let us get started with Tableau, so once you open, you have the public interface like this, so you can download this video games data set from Kaggle, where the link is given here, so I am just going there, so this is the video game sales data set, of course you have to log in into Kaggle using your Gmail account, so it is pretty simple, so this is the data set, so what is the data set? It says, okay, so it covers the video game sales, right, there are 9 columns of data, then you have the different data type, I mean different type of games that are there, so then you can simply download this particular data and there are 3 different sheets within this, so which is which is already downloaded in my system, okay, I have already downloaded this particular data set, you can just click it here and you will get the data, so once you have this data, we have to connect this to the Tableau system, so how do we do that? We go here, see there is a very intuitive framework, you can simply click on Microsoft Excel and there is Superstore, yeah, just, okay, so let me just download this data again, so PS4 games sample sense.csv, so choosing this, yeah, so the problem is it has to, so the point is it was a CSV file, I tried to upload it as an Excel, so you have to be careful, so you have to choose a text file here, so then you are getting the CSV, so this is what, you got the data, you just have to select the right file type, you have all the data's that you have here, okay, so there are so many data's here, so I am just selecting the PSV data and we will come back to how to manage this data, this is the just overview of the data, so you have the field names which are here, then the different data or the actual data that is there here, so and what you can do in this pane at a later stage is to build, let us say there are 3-4 Excel sheets of the same data, in one sheet you have the sales per region, in the second sheet you have sales per the

product, so you can connect these two sheet, two data sheets and also define relationship between them, so all this can be managed here which will be looking a little later in other lessons, but now we just downloaded the, connected with the CSV data, then you can try to create, you can play around with the properties here and define what is the data structure that is coming into the visualisation pane, so now this is data management tab, so that's why it is called data source, right next to it you have sheet 1, where the actual visualisation can be done, so in Tableau the way it works is, you have the data pane which is on to the left, there are tables and there are measure names, so this is what we call the dimension pane, where there are categorical variables which can be used for slicing and dicing, the data building hierarchies, then you have the measure names which are the quantitative variables, where you have the values for different types, okay, so then you have the filters, then you have the actual visualisation pane, where you have the, this is the column field, this is the row field, so this is very intuitive, all that you have to do is drag and drop the columns that you want to see and select the visualisation that you want to do, so this is the basic interface in Tableau, so what we just did was to connect with some sample data and now we will try to explore it further, okay, so we have connected this, so we have just taken this data, so please choose the right data type, so for cs we have to choose the text, now just coming a bit before going into the data set, okay, you need to understand what are the different data types in Tableau, so you have Boolean values which are true and false, so then you have the date values, so which are represented by this, you have date and time values, where there is even more further detail which will have a small calendar plus a time, a clock symbol, then you have the numerical values on which you can operate the aggregations calculations, we just spoke about Boolean values, then you have the text, then you have the geographical values, right, so which indicate the location, so automatically the data types are detected by Tableau, but as in case of any data software while you are importing, you can try to rework the data types, okay, you can try to describe the data types and rework on them, okay, so you can click on this, you can change the type if there is any error or try to understand what is the data type, you want how it to be presented, all this can be modified in the data source, so that you will have the right visualisations, right aggregations or calculations in the visualisation pane, so now having done that, let us now come to the basic terminologies that are used, so this is the toolbar and this is the column and row shelves, you have the marks card, the data pane and the canvas or the visualisation pane, so this is the toolbar that we have shown just now, then you have the visualisations or pane here, where what are the different type of visualisations, then you have the marks filter, then the data pane here and the final, the large area is for canvas for building the visualisations.

Now, let us try to do your simple first plot, there will be looking at how to create a simple line graph, okay, so we are trying to put column, okay year wise, we want to understand, so this is year wise, so then we just want to understand what are the global sales, okay, some global sales, so let us go to what are the sales, okay and just making it a line graph, so this is the global sales, so you can then just have the global

sales plot, okay, the data looks little different than what is there in here but however, this is the data that we have and of course, during COVID, you had lesser data but you have overall how the sales data is going up, okay, so this is how you can create a very simple chart, we will then complicate it and then see what else can be done, so this is one more thing what we have done is, we can add other parameters and slice and dice and you can remove, so we can do all these characterisations once we are in the environment, okay, please do take type, get familiarised how to download, instal the software and connect with an excel sheet and see couple of how to do videos, you will have a better understanding of the environment.

-----End-----
