

Module Introduction Transcript

Hey, hello everyone, welcome to this entire new module which is called as Bayesian inference. Think of how confident are you about anything, let's say for example, there is a new match which is going to get played between your favourite team against any new team, right? So how confident are you that your favourite team is going to win? Maybe very much, maybe very least, right? Similarly, let's say your team has developed a marketing campaign about any new product that they are launching. How confident are you that the marketing campaign is going to be successful? So there are these types of situations or uncertainties in life for which we need to model or we need to prepare certain types of statistics or models or approaches which gives us a clear-cut idea about how to model these uncertainties in life, right? So we generally have two different types of approaches in statistics.

One which is called as Frequentist. All of the modules that you have learned till now, it dealt with p-values, hypothesis testing, tests and all, right? That particular part is called as Frequentist approach. The second part of it wherein we are trying to tell more about the likelihoods, more about the probabilities, more about modelling for the chances, more about thinking of how would we be able to understand what is going to happen given that that is not certain to happen, right? So in all of those situations, we will deal with probabilistic nature.

Some of the times, we will be dealing with conditional probabilities and so on, okay? So this entire approach wherein we are dealing with likelihoods and we are dealing with conditions, that is called as Bayesian approach and this new school of thought which is increasingly very vital and also is very much used in quantifying some of the uncertainties in life is called as Bayesian inference and that's what we are going to learn in next two videos. I hope this entire journey would be really thought-provoking and as well as very much motivating to all of you. So let's begin our journey.
