

Visual Makeover Case Study Transcript

Now, coming to strategic use of brand colours in the visuals. As I mentioned in today's evolving competitive landscape, the differentiation is a key factor and every company is trying to create its own mark. If you ah go to any management consultancy or for any corporate decent corporate firm, the font on the text the text type colour that they use in their internal documentations is fixed.

In fact, in the very first onboarding process, you are taught about specific combinations of colour, font, colour that you have to use in the official communication. In this context, while building internal official documents that involve visualisations, you are expected to use the brand colours. However, the colour schema might not always be optimal or effective for building graphics.

Therefore, it is a trade off or a call that you have to take as a business analyst to how to portray the communication without diluting his message using brand colours as much as possible or using another appropriate scheme without contrasting with the brand colours and conveying the message. This is something that has to be thought of in specific context where there is a requirement to use the brand colours. So, we have to ah think through the alternative combinations of colours that convey the meaning without diluting the message and if possible, we can use the brand colours.

If not, we can convince the audience say that this is a visualisation best suited in this particular colour format. Finally, visuals strategic use of colours, we have to talk about positioning. Positioning is a very important aspect in within the visual design space.

Whenever we are talking about data visualisation, what are we essentially discussing? We are discussing a spatial arrangement of different elements in a limited space to convey a particular meaning. When you consider a graph, it is x and y axis, the bars and the labels, maybe the text call outs all these are interacting in a small space. We need to understand how this positioning is affecting the message that we are trying to convey.

Generally, our human mind is trying to read from top to bottom from left to right as shown in the figure 1, 2, 3, 4 it is in a zig in a z form. It starts at the top, moves to left to right and then comes bottom again moves to the right. This is our intuitive our mind is trained.

So always if possible, try to build your visual elements in this flow and try not to go against the flow, which means building something from right to left or bottom to top can be very counterintuitive and might not solicit the full attention of the audience or they might have to spend higher cognitive ability to process the information leading to at times inefficiency and loss of messaging. So it has to be taken care how are you positioning various elements in your graphic. The most important elements have to be

placed at the top and you can sequentially then move down to create other artefacts include other artefacts in the visualisation.

You have to keep in the view that positioning is a strategic choice, it is not done arbitrarily. If you have to position certain elements, you have to think whether the attention is going directly to that element or it is blocking the message that you are conveying in the visual. With these aspects in mind and you use the pre attentive attributes and position them well in the visual, your visualisation clarity improves multifold.

So there are certain do's and don'ts with regard to position. So you can take them as guiding principles and apply them while designing your visuals. Most importantly, you should design a visual that feels natural and intuitive to your audience without you being there to support them for understanding the visual.

Remember, you are trying to communicate to a wider base of audience, always try to keep in mind how they would perceive your visualisation and position the pre attentive elements, be it colour, text, size or other objects.

Thank you
