

Gestalt's Principle of Visual Medium Transcript

Now we will look at other types of clutter. First and foremost, lack of visual ordering. I would like your attention to the just like principles where we have discussed the principle of continuity.

Human intuition is tuned to perceive trends that are continuous. Therefore, if there is a visual ordering in the graphic, it is more appealing to the human eye. We should try to present the logical order within the graphs so that people can readily observe those trends and draw conclusions.

For example, the graphic on your left has a visual order and it tries to showcase the demonstration of results is the most important character that people look for a service provider. And this is presented in this graphic and there are certain text elements showcasing the narration saying that the survey has showed that the demonstration of results is the most important characteristic. However, the same visual looks cluttered despite having a visual order.

We need to reimpose this visual order by removing the clutter around the graphic and try to use the space in a more efficient form. For example, to highlight that the demonstration of results is the most important characteristic on the visual order you can do a bold or highlighting of the main result and the other results also which you think are important. This creates immediate attention to the demonstration of results.

Simultaneously, one can tone down the narration and highlight the key aspects to bring more attention to the visual. This is just a small decluttering exercise to show that how you can still use the lack of visual order and reinforce the visual order in a significant form.
