

Matplotlib Visual Basics Transcript

So, then we will quickly now move to a live session, wherein we will explore the basic features of Matplotlib, and from there on take how to use the Matplotlib for building advanced visualisations ok. So, now let us start with a Colab environment or a Jupyter notebook, for the ones who are using Python, using a normal Anacondas environment and use a Jupyter notebook, you can do the same thing. I am using Google Colab feature, which is more of a cloud based execution of the Python codes.

So, it is little more user friendly, so it does not make much of a difference as far as the code execution and the environment thing. So, you can go to your Google Chrome browser, and type Google Colab, so all you need is to have a Google account, and then you will be able to open the interact with this ok. So, I am just opening a new notebook, so that people who are new to this environment can get accustomed right.

Once you open the Colab, this is how the interface will look like, so this is where you will start coding right. So, I can just say hi, and if you use your hash, it will be annotated, it would not be executed as a code, and otherwise if you write anything in line that is treated as a code. So, this is a very simple thing, so all that you have to remember is, you have the interface where you have to start coding, and once you want to run, you will click this button.

And there is also a separate text like for example, I just want to write, this is introduction to a math plot like Python libraries or data visualisation course, so I just, so do this, this will become a text element ok. So, you can do all the elements like you can bold, so while creating this, you can simply write, this is how it will look like, so once you click, this has come, so you are trying to create a nice presentation within the Colab environment to share with your friends or your working, work colleagues, so Colab has one interesting feature, the very fact Colab is collaborative, you can share this in real time and people can review your work and give back comments ok. And one interesting feature is, you have the Gemini assistance here, so if you do not understand something or you want help with something,

you can always ask Gemini for example, how to import matplotlib, so I just ask this question to Gemini, so it will tell me or it will guide you in how to do certain things, so you can also take support from the intelligent agents which are present in the Google environment, accept and run, so moment you asked, it said `import matplotlib as plt`, so this is the command which you are using for importing the matplotlib ok, so then it gives you some other features also like suggestions, so this is just a feature that I am explaining to you only if you are,

when you are stuck or you want to understand or you want to get some help, you can readily use this feature.

-----End-----
