

Module Introduction Transcript

Hello everyone, welcome to module 6 of our course Statistical Inference and Modelling. So far we have studied estimation, hypothesis testing, analysis of variance. Each of these methods allows us to answer specific questions about population and groups.

Now we move to a very powerful and widely used tool in statistics called linear regression. The module learning objectives are as follows. The first you will learn how to build a simple linear regression model and use least square methods.

Second, you will learn about how to assess models significance and interpret the coefficients. Third, you will learn how to use regression models for predictions and statistical analysis. By the end of this module, you will have a clear understanding of how to use model and its different types of things to build a linear relationship.

So, let's begin.
