

Module Introduction Transcript

Hello everyone, welcome to module 5 of our course Statistical Inference and Modelling. In the previous modules, we learnt how to compare one or two populations using estimation, hypothesis testing. But in this, we'll be learning much more about real-world situations.

We need to compare more than two groups, right? For example, we might want to four different teaching methods. This module will make us learn about the following things. First, we'll learn about how to understand completely randomised designs and then we'll move into randomised block designs.

Second, you'll learn how to perform analysis of variance or what we call as ANOVA to determine whether significance is actually existent between the groups. Third, you'll learn about how to interpret ANOVA or ANOVA's results and make decisions out of it. By the end of this module, you'll have a solid foundation in experimental design and ANOVA, which are essential tools for analysing data across multiple groups.

Let's begin!
